Geoffrey Hunt & Associates Ltd.,

How, where and who could build a prototype unit? Or is this not possible as Lucid Energy Technologies of USA holds the worldwide rights to the GHT design!

Where could it be tested ? – a Government sponsored test facility like NAREC, Blyth, Northumberland or at HR Wallingford. Oxon. Alternatively, in a suitable river free from navigation such as the Mersey river between the Eastham Locks and the Port of Garston.

Where is the money coming from – The Carbon Trust, the 6 major electrical generating companies, or the 18 electrical distribution companies?

Whilst other countries are testing GHTs in South Korea, USA etc, I believe that no one in the UK has proposed such a trial – why not?

Instead, the UK's efforts have been towards other types of turbines and tidal barrage schemes, all of which are very costly – just too much money in this economic climate !
